Math 335, Exam 3

May 12, 2021

Name: ___Mark Kim

Problem	Points Scored	Total Points Possible			
1		8			
2		8			
3		8			
4		8			
5		8			
Total		40			

Problem 1: Let

$$G = \mathbb{Z}_{12} = \{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11\},\$$

which is a group under addition modulo 12, and let

$$H = \langle 3 \rangle \subseteq G.$$
 $\{0, 3, 6, 9\}$

You do not need to explain your answers or provide any justification on this problem.

(a) How many elements are there in the quotient group G/H?

$$|S/H| = \frac{161}{1111} = \frac{12}{4} = 3$$

(b) List all of the elements in G/H, being sure to list each one only once.

(c) What is (2 + H) + (2 + H)? Express your answer as one of the elements in your list from part (b).

(So, for example, $\varphi(4) = 1$ and $\varphi(8) = 2$.) You do **not** need to explain your answers or provide any justification on this problem.

(a) What is the kernel of
$$\varphi$$
? List all of its elements. $\ker (\mathcal{C}) = \{g \in G \mid \mathcal{C}(g) = e^{g}\} = \{\chi \in \mathcal{I}_{12} \mid \mathcal{C}(\chi) = 0\}$

$$= \{0,3,6,9\} = \{3\}$$

(b) What is the image of
$$\varphi$$
? List all of its elements.

in (4) =
$$\begin{cases} h \in H \mid h = \ell(g) \text{ for sine } g \in G \end{cases} = \begin{cases} \chi \in \mathbb{Z}_3 \mid \chi = \ell(g) \text{ for } g \in G \end{cases}$$

$$= \begin{cases} 0,1,2 \end{cases}$$

(c) Which theorem now tells us that
$$\mathbb{Z}_{12}/\langle 3 \rangle \cong \mathbb{Z}_3$$
?

(d) Write down an explicit isomorphism

$$f: \mathbb{Z}_{12}/\langle 3 \rangle \to \mathbb{Z}_3$$

by saying where f sends each element of $\mathbb{Z}_{12}/\langle 3 \rangle$. (You may find it helpful to look back at Problem 1(b), where you listed all of the elements of $\mathbb{Z}_{12}/\langle 3 \rangle$.)

Problem 3: Let

$$G = D_4 = \{e, r_{90}, r_{180}, r_{270}, h, v, d, d'\}$$

be the group of symmetries of a square, and let

$$H = \{e, h\} \subseteq G$$
,

where e denotes the identity and h denotes the reflection across a horizontal axis. Here's a table for the group D_4 , for your reference:

	e	r_{90}	r_{180}	r_{270}	h	v	d	d'
e	e	r_{90}	r_{180}	r_{270}	h	v	d	d'
r_{90}	r_{90}	r_{180}	r_{270}	e	d'	d	h	v
r_{180}	r_{180}	r_{270}	e	r_{90}	v	h	d'	d
r_{270}	r_{270}	e	r_{90}	r_{180}	d	d'	v	h
h	h	d	v	d'	e	r_{180}	r_{90}	r_{270}
v	v	d'	h	d	r_{180}	e	r_{270}	r_{90}
d	d	v	d'	h	r_{270}	r_{90}	e	r_{180}
d'	d'	h	d	v	r_{90}	r_{270}	r_{180}	e

(a) Show that H is **not** a normal subgroup of G.

$$r_{n0} \circ h \circ r_{n0} = r_{n0} \circ h \circ r_{270}$$

$$= r_{n0} \circ d'$$

$$= V \notin H :: H is not a subgroup$$

(b) Use an example to show that composition of left cosets

is **not** well-defined.

Problem 4: You do **not** need to explain your answers or provide any justification on this problem.

(a) List all of the elements of the group $\mathbb{Z}_2 \oplus \mathbb{Z}_4$.

$$(0,0), (0,1), (0,2), (0,3)$$

 $(1,0), (1,1), (1,2), (1,3)$

(b) Is it true that $\mathbb{Z}_2 \oplus \mathbb{Z}_4 \cong \mathbb{Z}_8$? Briefly explain your answer, using any of the theorems we have learned in class.

By hown,
$$\mathbb{Z}_2 \oplus \mathbb{Z}_{y_1} \cong \mathbb{Z}_y \iff \gcd(n,m)^{-1}$$

 $\gcd(2,4) = 2 : \mathbb{Z}_2 \oplus \mathbb{Z}_4 \not= \mathbb{Z}_8$

(c) List all abelian groups with 36 elements, making sure that no two of the groups in your list are isomorphic to one another.

$$36 = 2 \cdot 2 \cdot 3 \cdot 3$$

$$Z_{2} \oplus Z_{1} \oplus Z_{3} \oplus Z_{3}$$

$$Z_{2} \oplus Z_{2} \oplus Z_{3}$$

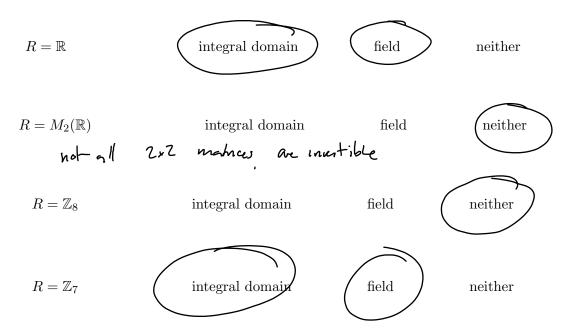

$$Z_{4} \oplus Z_{3} \oplus Z_{3}$$

$$Z_{4} \oplus Z_{9}$$

$$Z_{9} \oplus Z_{9}$$

Problem 5: You do **not** need to explain your answers or provide any justification on this problem.

(a) For each of the following rings, circle "integral domain", "field", or "neither". Circle more than one if more than one applies.

(b) Give an example of a subset $I \subseteq \mathbb{Z}[x]$ that is an ideal.

T= { polynomials with constant term 0}

(c) Give an example of a subset $I \subseteq \mathbb{Z}[x]$ that is **not** an ideal.

[= Elinear polynomials]
